

# Lesson 4 (2021-04-27) : What to know about black holes

2021年4月20日 16:42

## Basic of Black Holes:

- In Newtonian mechanics, obtain the radius of a star with mass  $M$ , where the escape-velocity is equal to the light velocity. Compare this with the Schwarzschild radius.

$$E = \frac{1}{2}mv^2 - G\frac{Mm}{r} = 0 = \frac{1}{2}m v_{esc}^2 - \frac{GMm}{R}$$

$$v_{esc} = \sqrt{\frac{2GM}{R}}$$

$v_{esc} \rightarrow c$

$$c = \sqrt{\frac{2GM}{R}}$$

$$R = \frac{2GM}{c^2}$$

agree!

$$R_s$$

$\sim 80 M_{\odot}$   
 ↑ Gravitational Wave (BH merger)

- Maximum known mass of "stellar" black holes? (See these [article](#) and [paper](#) by LIGO collaboration)

$$\text{GRS1915+105 } M \approx 14 M_{\odot}$$

↳ X-ray source

- Mass of the black hole in the center of our Galaxy (Sgr A\*)? (A latest result, [Stellar Orbits around the black hole, Nobel Prize 2020!](#))

$$\sim 4 \times 10^6 M_{\odot} \leftarrow \text{precise!}$$

- Maximum known mass of super-massive black holes (AGN, quasars)?

$$\sim 10^9 M_{\odot} \leftarrow \text{approximate}$$

- Are there "intermediate mass black holes (IMBHs)" with a mass of 100-1000 Msolar? Which sources are the candidates of the intermediate mass black holes?

VLXs

Not sure!!

Ultraluminous X-ray Sources

A 400-solar-mass black hole in the galaxy M82 ?

Maybe  $\sim 20 M_{\odot}$  BH shining at super-Eddington luminosity

## Feel the "size" of Black Holes:

- Estimate apparent size of a black hole, dividing the Schwarzschild radius by the distance to the source. Which is easier to "resolve", stellar black hole in our Galaxy, or super-massive black holes in other galaxies?

$$\Delta \theta \approx \frac{R_s}{d} = \frac{\frac{2GM}{c^2}}{d} = \frac{3 \text{ km } (M/M_{\odot})}{d} = \frac{30 \text{ km } (M/10 M_{\odot})}{(d/10 \text{ kpc}) 10 \text{ kpc}}$$

$$\left[ 1 \text{ pc} \approx 3 \times 10^{13} \text{ km} \right] \approx \frac{30 \text{ km } (M/10 M_{\odot})}{10 \times 10^3 \times 3 \times 10^{13} \text{ km } (d/10 \text{ kpc})} = 10^{-16} [\text{rad}] \left( \frac{10/10 M_{\odot}}{(d/10 \text{ kpc})} \right)$$

$$1 \text{ rad} = \frac{180^\circ}{\pi} = \frac{(180 \times 3600)''}{\pi} = 2 \times 10^5 \text{ (arcsec)}$$

- Estimate spatial resolution of a radio interferometer at 1mm, where the base-line is 10,000 km (=maximum on Earth). Also, estimate spatial resolution of an X-ray interferometer at 1 Å, with the base-line is 10 m. Which has better spatial resolution?

$$\Delta \theta \approx \frac{\lambda}{B} \approx \frac{1 \text{ mm}}{10^4 \text{ km}} \approx 10^{-10} [\text{rad}] \approx 20 [\mu \text{ arcsec}]$$

$$\Delta \theta \approx 2 \times 10^{-11} \text{ (arcsec)}$$

$$\left( \frac{M/10 M_{\odot}}{(d/10 \text{ kpc})} \right)$$

Stellar BH

Sgr A (M  $\approx 4 \times 10^6 M_{\odot}$ , d  $\approx 8 \text{ kpc}$ )

$$\Delta \theta \approx 2 \times 10^{-11} \cdot \frac{4 \times 10^6}{0.8} = 10^{-5} \text{ (arcsec)}$$

Event horizon telescope on the earth

our dream!

3. According to General Relativity, "Photon-capture radius" of a black hole is  $\sqrt{27} r_g$ , where  $r_g$  is the gravitational radius ( $=GM/c^2$ ). In 2020, the Event Horizon Telescope observed a bright photon "ring" around central blackhole M87 (distance = 16.8 Mpc), where the diameter was 42  $\mu$ as. By identifying the ring radius as the photon-capture radius, estimate the black hole mass. (see 2019ApJ...875L...1E)

$M \approx 6.5 \times 10^9 M_\odot$

$\Delta\theta = 42 \mu\text{as} = \frac{2\sqrt{27} r_g}{d}$

$42 \cdot 10^{-6} \frac{1}{2 \times 10^5} = \frac{2\sqrt{27} \cdot \frac{GM}{c^2}}{16.8 \text{ Mpc}}$

$= \frac{2\sqrt{27} \times 1.5 \frac{M}{10}}{16.8 \times 10^6 \times 3 \times 10^{18} \text{ cm}} = \frac{2\sqrt{27} \times 1.5 \frac{M}{10}}{50 \times 10^8}$

$\frac{M}{M_\odot} = \frac{42 \cdot 10^{-6} \cdot \frac{1}{2 \times 10^5} \times 50 \times 10^8}{2\sqrt{27} \times 1.5 \times 10^8} = 6.5 \times 10^9 M_\odot$

$\Delta\theta \approx 2 \times 10^{-5} \cdot \frac{4 \times 10^4}{0.8} = 10^5 \text{ [arcsec]} = 10^9 \text{ [microarcsec]}$

$\Delta\theta = \frac{1 \mu\text{m}}{10 \text{ m}} = \frac{10^{-6} \text{ m}}{10 \text{ m}} = 10^{-11} \text{ [rad]}$

4. Assume that black hole is a sphere having the Schwarzschild radius (ignore General relativistic effects). Estimate "density" of the black hole, simply dividing the mass by the volume. Is the density smaller or larger for more massive black holes?

$\rho = \frac{M}{V} = \frac{M}{\frac{4}{3}\pi R^3} \approx \frac{M}{4 \cdot (2GM/c^2)^3} \approx \frac{1}{4} \frac{(M/M_\odot) M_\odot}{(3 \text{ km})^3 (M/M_\odot)^3} \approx \frac{1}{4} \frac{M_\odot}{(3 \text{ km})^3} \left(\frac{M}{M_\odot}\right)^{-2}$

$M_\odot \approx 2 \times 10^{33} \text{ [g]} \quad \rho \approx \frac{1}{4} \cdot \frac{2 \times 10^{33} \text{ [g]}}{27 \cdot 10^{25} \text{ [cm}^3]} \cdot \left(\frac{M}{M_\odot}\right)^{-2} \approx 2 \times 10^{16} \text{ [g/cm}^3] \left(\frac{M}{M_\odot}\right)^{-2}$

5. Can the black hole "density" smaller than that of water? If yes, when?

$2 \times 10^{16} \text{ [g/cm}^3] \left(\frac{M}{M_\odot}\right)^{-2} < 1 \text{ [g/cm}^3]$

$\left(\frac{M}{M_\odot}\right)^2 > 2 \times 10^{16} \quad \frac{M}{M_\odot} > 10^8$

$\rho_{\text{water}} \approx 10^3 \text{ [g/cm}^3]$

6. Estimate light-crossing time of the Schwarzschild radius of a black hole with mass M.

$\Delta t \approx \frac{R_s}{c} \approx \frac{2GM/c^2}{c} \approx \frac{1}{c} 3 \text{ km} \left(\frac{M}{M_\odot}\right) = \frac{3 \times 10^3 \text{ [m]}}{3 \times 10^8 \text{ [m/s]}} \frac{M}{M_\odot} \approx 10^{-5} \text{ [sec]} \frac{M}{M_\odot}$

not easy to handle  $\approx 10^4 \text{ [sec]} \left(\frac{M}{10^8 M_\odot}\right)$

7. Which is technically easier to detect X-ray variability taking place near the Schwarzschild radius, stellar mass black holes or super-massive black hole?

$\Delta t \approx 0.1 \text{ msec} \left(\frac{M}{10 M_\odot}\right)$   
 $\approx 1000 \text{ [sec]} \left(\frac{M}{10^8 M_\odot}\right)$

AGN

easy to handle
